

LIST OF TABLES

	<u>page</u>
Table 1. Soil series existing on watershed	9
Table 2. Properties of the soil samples collected in the field	10
Table 3. Volume drained, upflux, and Green-Ampt input values for water management models	11
Table 4. Estimates of nutrient concentrations for various combinations of soil types, field drainage designs, and canal control management.	17
Table 5. Rooting depths and the three canal control management strategies for the annual cropping scenarios.	20
Table 6. Field drainage designs for different soil types and canal control practices on the watershed	21
Table 7. Summary of land areas for each combination of crop rotation, canal control, and soil type currently existing on the watershed.	22
Table 8. Average volume or depth of water drained from fields by surface and subsurface drainage for each combination of field design, canal control, crop, and soil group.	24
Table 9. Average lateral seepage from ditches for each combination of field design, canal control, crop, and soil group.	25
Table 10. Average evapotranspiration from fields for each combination of field design, canal control, crop, and soil group.	26
Table 11. Average surface runoff from fields for each combination of field design, canal control, crop, and soil group.	27
Table 12. Average subsurface drainage from fields for each combination of field design, canal control, crop, and soil group.	28
Table 13. Nitrate nitrogen efflux from fields for each combination of field design, canal control, crop, and soil group.	29
Table 14. Total Kjeldahl nitrogen efflux from fields for each combination of field design, canal control, crop, and soil group.	30
